

The figure displays three box plots side-by-side, each representing a different data group: red (left), blue (middle), and orange (right). Each box plot includes a central box representing the interquartile range (IQR), a horizontal line for the median, and vertical whiskers extending to the minimum and maximum values. Individual data points are overlaid on each box plot, colored to match their respective group. The red group shows a median around 4.5, the blue group around 4.0, and the orange group around 4.5. The orange group exhibits a much wider range of data points, with several high outliers reaching up to 10.0.
