

The figure displays three box plots side-by-side, each representing a different data group: red (left), blue (middle), and orange (right). Each box plot includes a central box representing the interquartile range (IQR), a horizontal line for the median, and vertical whiskers extending to the minimum and maximum values. Individual data points are overlaid on each box plot, colored to match their respective group. The red group shows a wider distribution with a median around 40. The blue group has a median around 50 and a single high outlier. The orange group is the most compact, with a median around 60 and a single low outlier.
