

The figure displays three box plots side-by-side, each representing a different data group: red (left), blue (middle), and orange (right). Each box plot includes a central box representing the interquartile range (IQR), a horizontal line for the median, and vertical whiskers extending to the minimum and maximum values. Individual data points are overlaid on each box plot, showing the distribution of the data. The red group has a median around 40, the blue group around 50, and the orange group around 60. The orange group shows a wider spread of data points, particularly at the lower end, compared to the other two groups.
